

ATTENTION

Pipe threads of fittings MUST HAVE O.E.M. APPLIED SEALANT COATING on them when screwed into brake valve body.

Check all fittings to be sure they are clean and free of foreign materials or sealant particles before using.

Any excess sealant that might extend over the ends of the pipe threads must be removed so as not to contaminate the system.

If your system uses 5/16" diameter brake lines (1/2" x 20 tube nut threads), contact MICO, Inc. for proper fittings.
